Weather Stop Curtains

Providing natural light and ventilation.

The Weather Stop curtain system is designed to close in large doors and openings on open front barns and commodity storage buildings, storage sheds and pavilions.

The fabric used is permeable allowing some air movement while maintaining a minimum level of ventilation. Due to the style of the fabric with small openings, rain and snow will not be allowed to penetrate and enter the building providing a protective barrier for the buildings contents.

The Weather Stop curtain system uses gear drives to roll the curtain up and down allowing easy and clear access into the structure when needed.

The fabric is a proprietary anti unravel knitted polyethylene with a high level of UV protection made for long life.

The Weather Stop curtain system is available up to 30' high.
